3-D-Optical Imaging in Diabetic Foot Care of Children

Syed Arif Kamal*, Mohummed Khalid Rajput* and Shahid Ali Khan*
*Department of Mathematics, University of Karachi; profdramal@gmail.com

Diabetes in children presents additional problems in terms of their feet care as they are by nature robust and active, indulging in play and activities involving climbing, jumping, running and walking. Polished, properly-fitting-pure-leather shoes (shoes with damaged internal surface should be, immediately, discarded) and clean, pure-cotton socks (disinfectant powder should be applied before putting on socks) should be worn for school, replacing dress shoes with sport shoes/trainers for sport participation. Whenever children go out in the garden, backyard or playground, they should be mandated to put on socks and sport shoes. Too loose (foot support may be used to adjust such shoes) or too tight shoes should not be used. The former increase the chances of accidents and injuries and the latter may block circulation. Parents should inspect feet of diabetic children upon arrival from school or sport events for blisters, cuts, sores or warts. If any such condition is suspected, a podiatrist should monitor the feet using visual, photographic and video means in the attention position, posture study, (Fig. 1a) as well as during walking and running, (gait study (Fig. 1b). The soles (Fig. 2) and the upper surfaces of feet must, also, be studied using moiré fringe topography (providing 3-D surface map) and rasterstereography (providing 3-D curvature map) — stereophotogrammetric, non-contact, non-invasive, non-infecting, non-destructive techniques providing permanent digital record. Edge-based moiré and edge-based raster could be employed to quantify infinitesimal movements during a gait cycle. Study of soles of feet on sand would provide clues to vascular-system disorders triggered by diabetes (Fig. 3). Facilities available in the SF Growth-and-Imaging Laboratory include anthropometry

Keywords: Moiré fringe topography, rasterstereography, edge-based algorithm, posture, gait, diabetes, feet

Conflict of Interest Statement: No potential conflict of interest is identified for this work.

Grant Sponsor: Dean’s (Science) Research Grant, University of Karachi, number DFSR/2009

Research Ethics: Project initiated after Institutional Review Process and conducted in compliance with ethical and human-right standards.
